Chloropleth Map

Proportional Symbol Map

Calendar Heatmap

Proportion of Total Area buried by State

Amount of rainfall throughout Summer

Line Chart - Streamgraph

CO₂ emissions vs trended targets

CO₂ emissions by Industry

Temperature in different cities

Filter

Temperature to the rest of the world change

- Keep Proportional Symbol / Chloropleth
- keep rainfall data visualisation

Categorise

Different attributes

Categorical

- Country
- States
- Industry

Quantitative

- Rainfall
- Temperature
- Brightness
- Year

Author: KAI WILLIAMS

Date: 20/09/2025

Sheet: 1

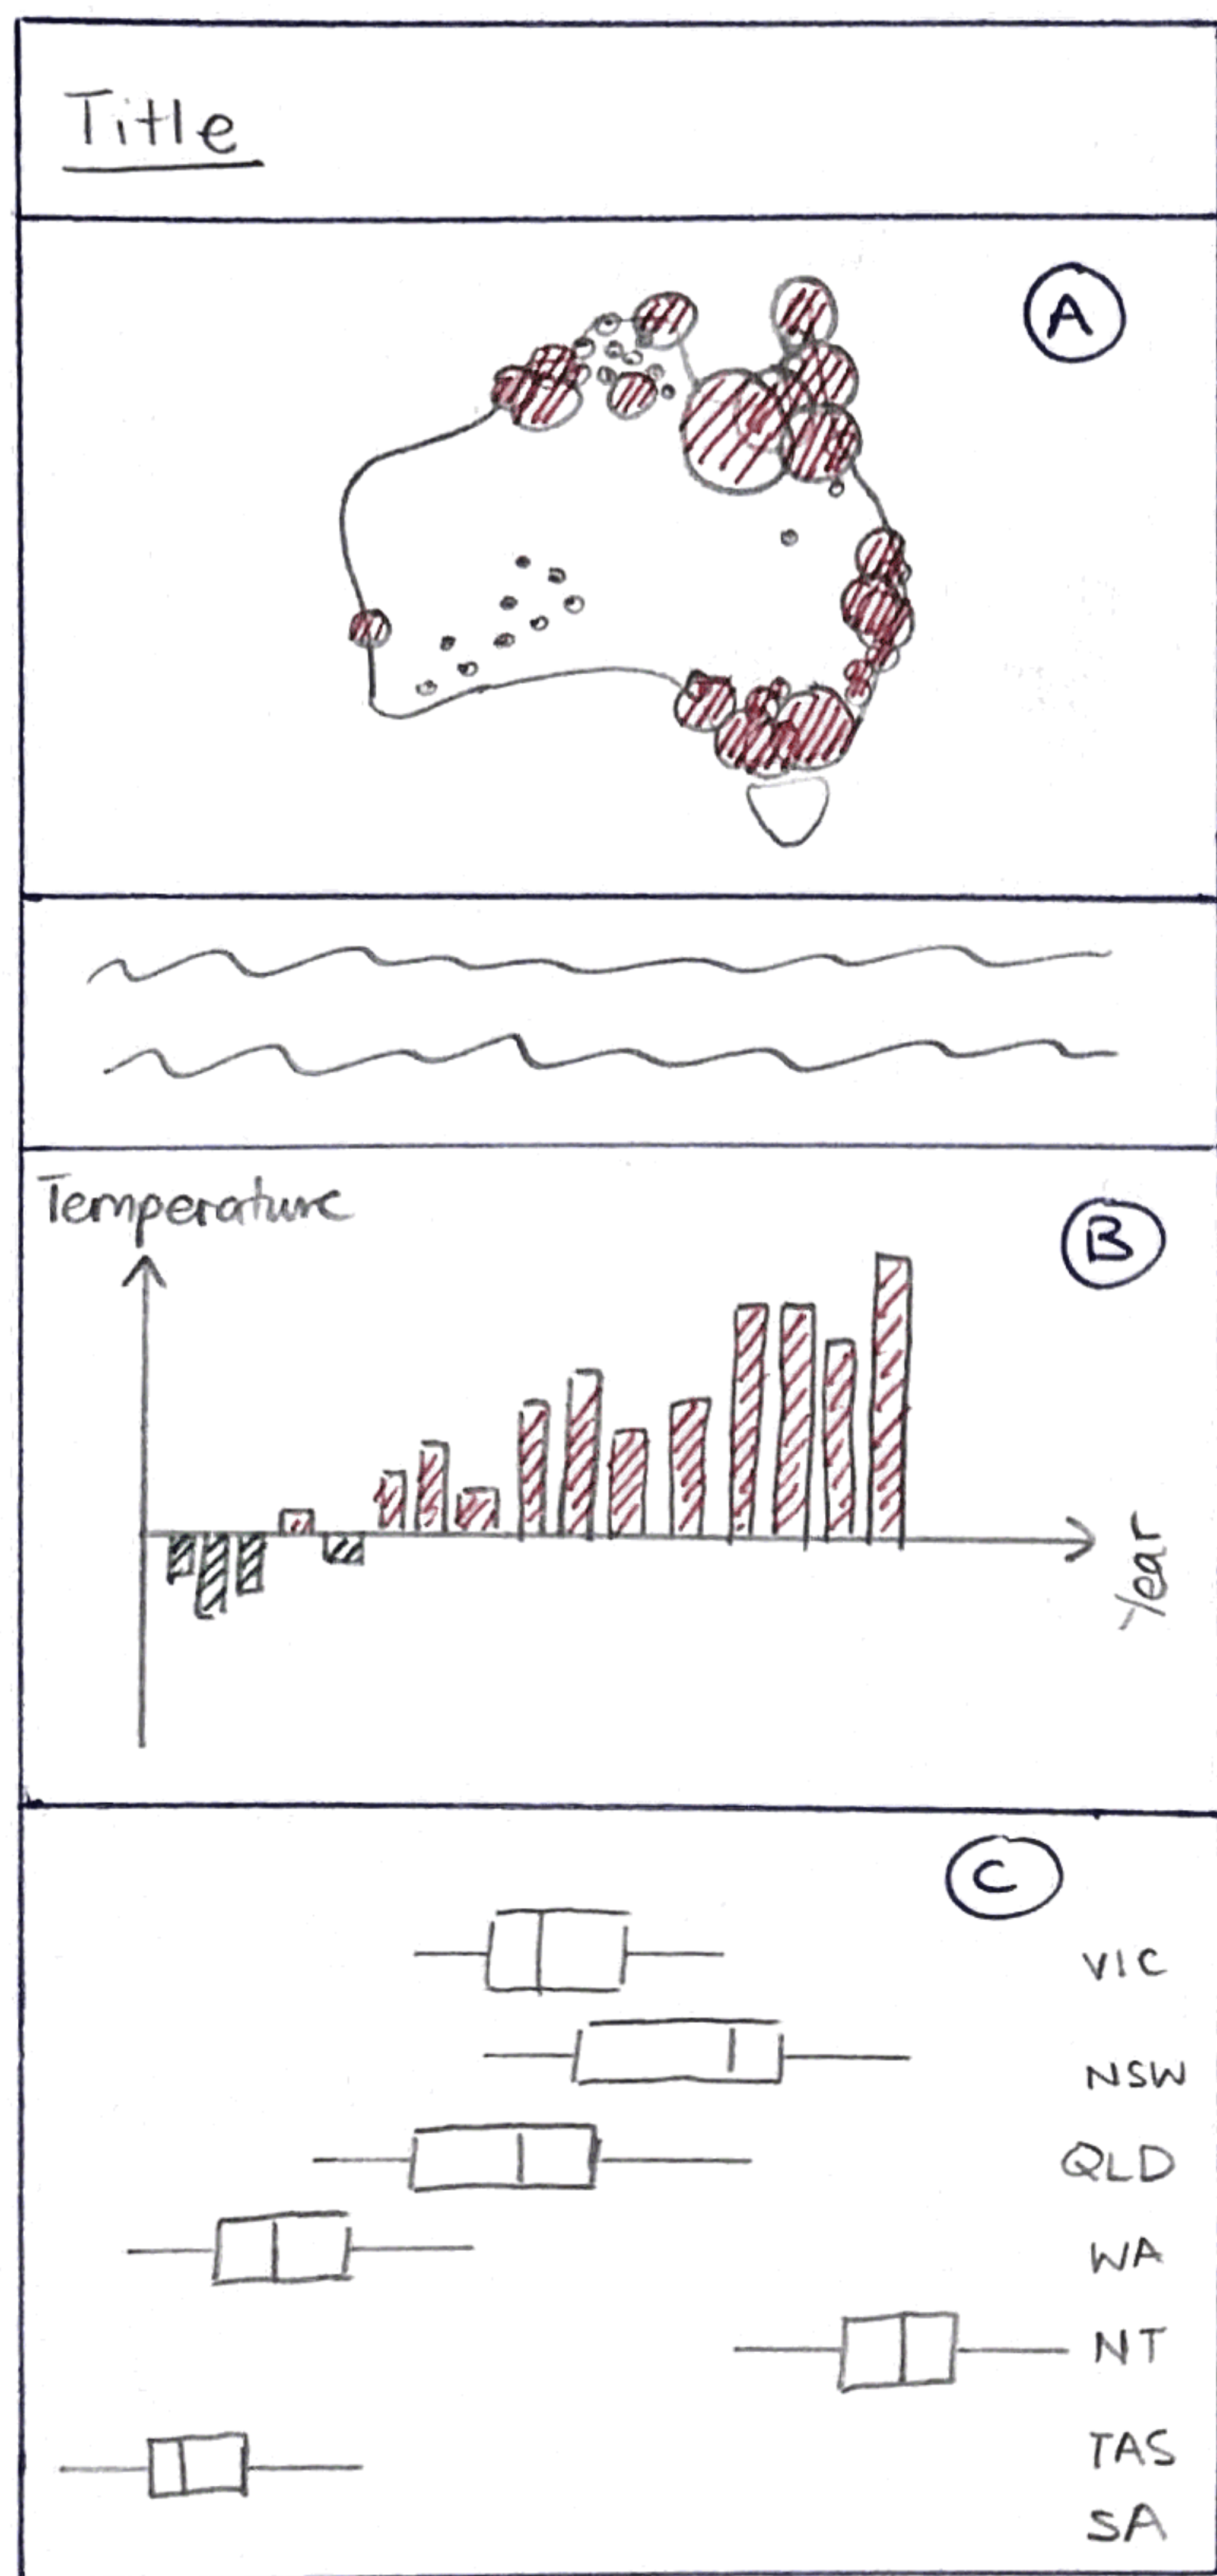

Combine and Refine

- Chart A may not provide much additional input, could possibly try and link it with chart B to hopefully make a link.
- May be difficult to change longitude and latitude data into chloropleth form. So proportional symbol may be the way to go.
- Uncertain about using data from different countries.

Questions

- Does comparing different countries CO₂ emissions really help in telling a story about fires in Australia?
- What is the focus of the visualisation? (Wildfires, Climate Change, CO₂ emissions, Weather?)

Layout

Focus

- No main focus, all graphs are important in telling the story.
- Graphs such as A should be bigger to emphasize its features (fire location + area burned/brightness data from satellite)

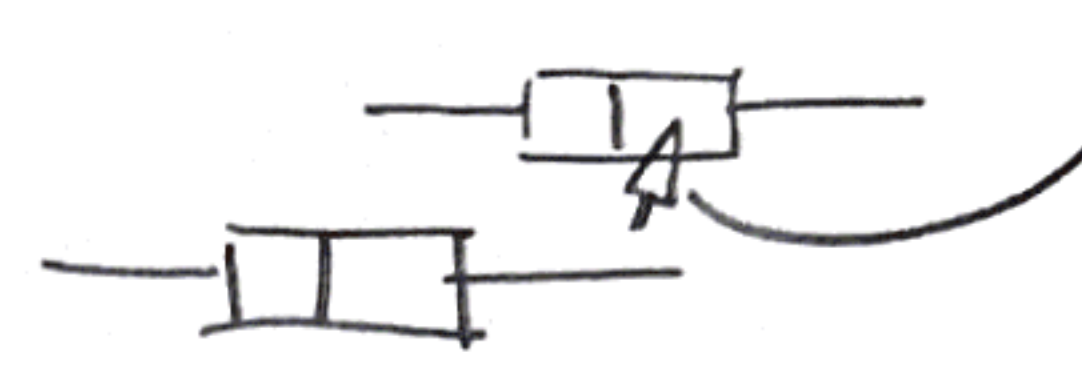

Title: Experimental Data Viz

Author: KAI WILLIAMS

Date: 20/09/2025

Sheet: 2

Operation

-  When you click on state, the relative circles on the proportional symbol match get map highlighted.

- Filter by range of Years.

- Filter by State (Map zooms in).

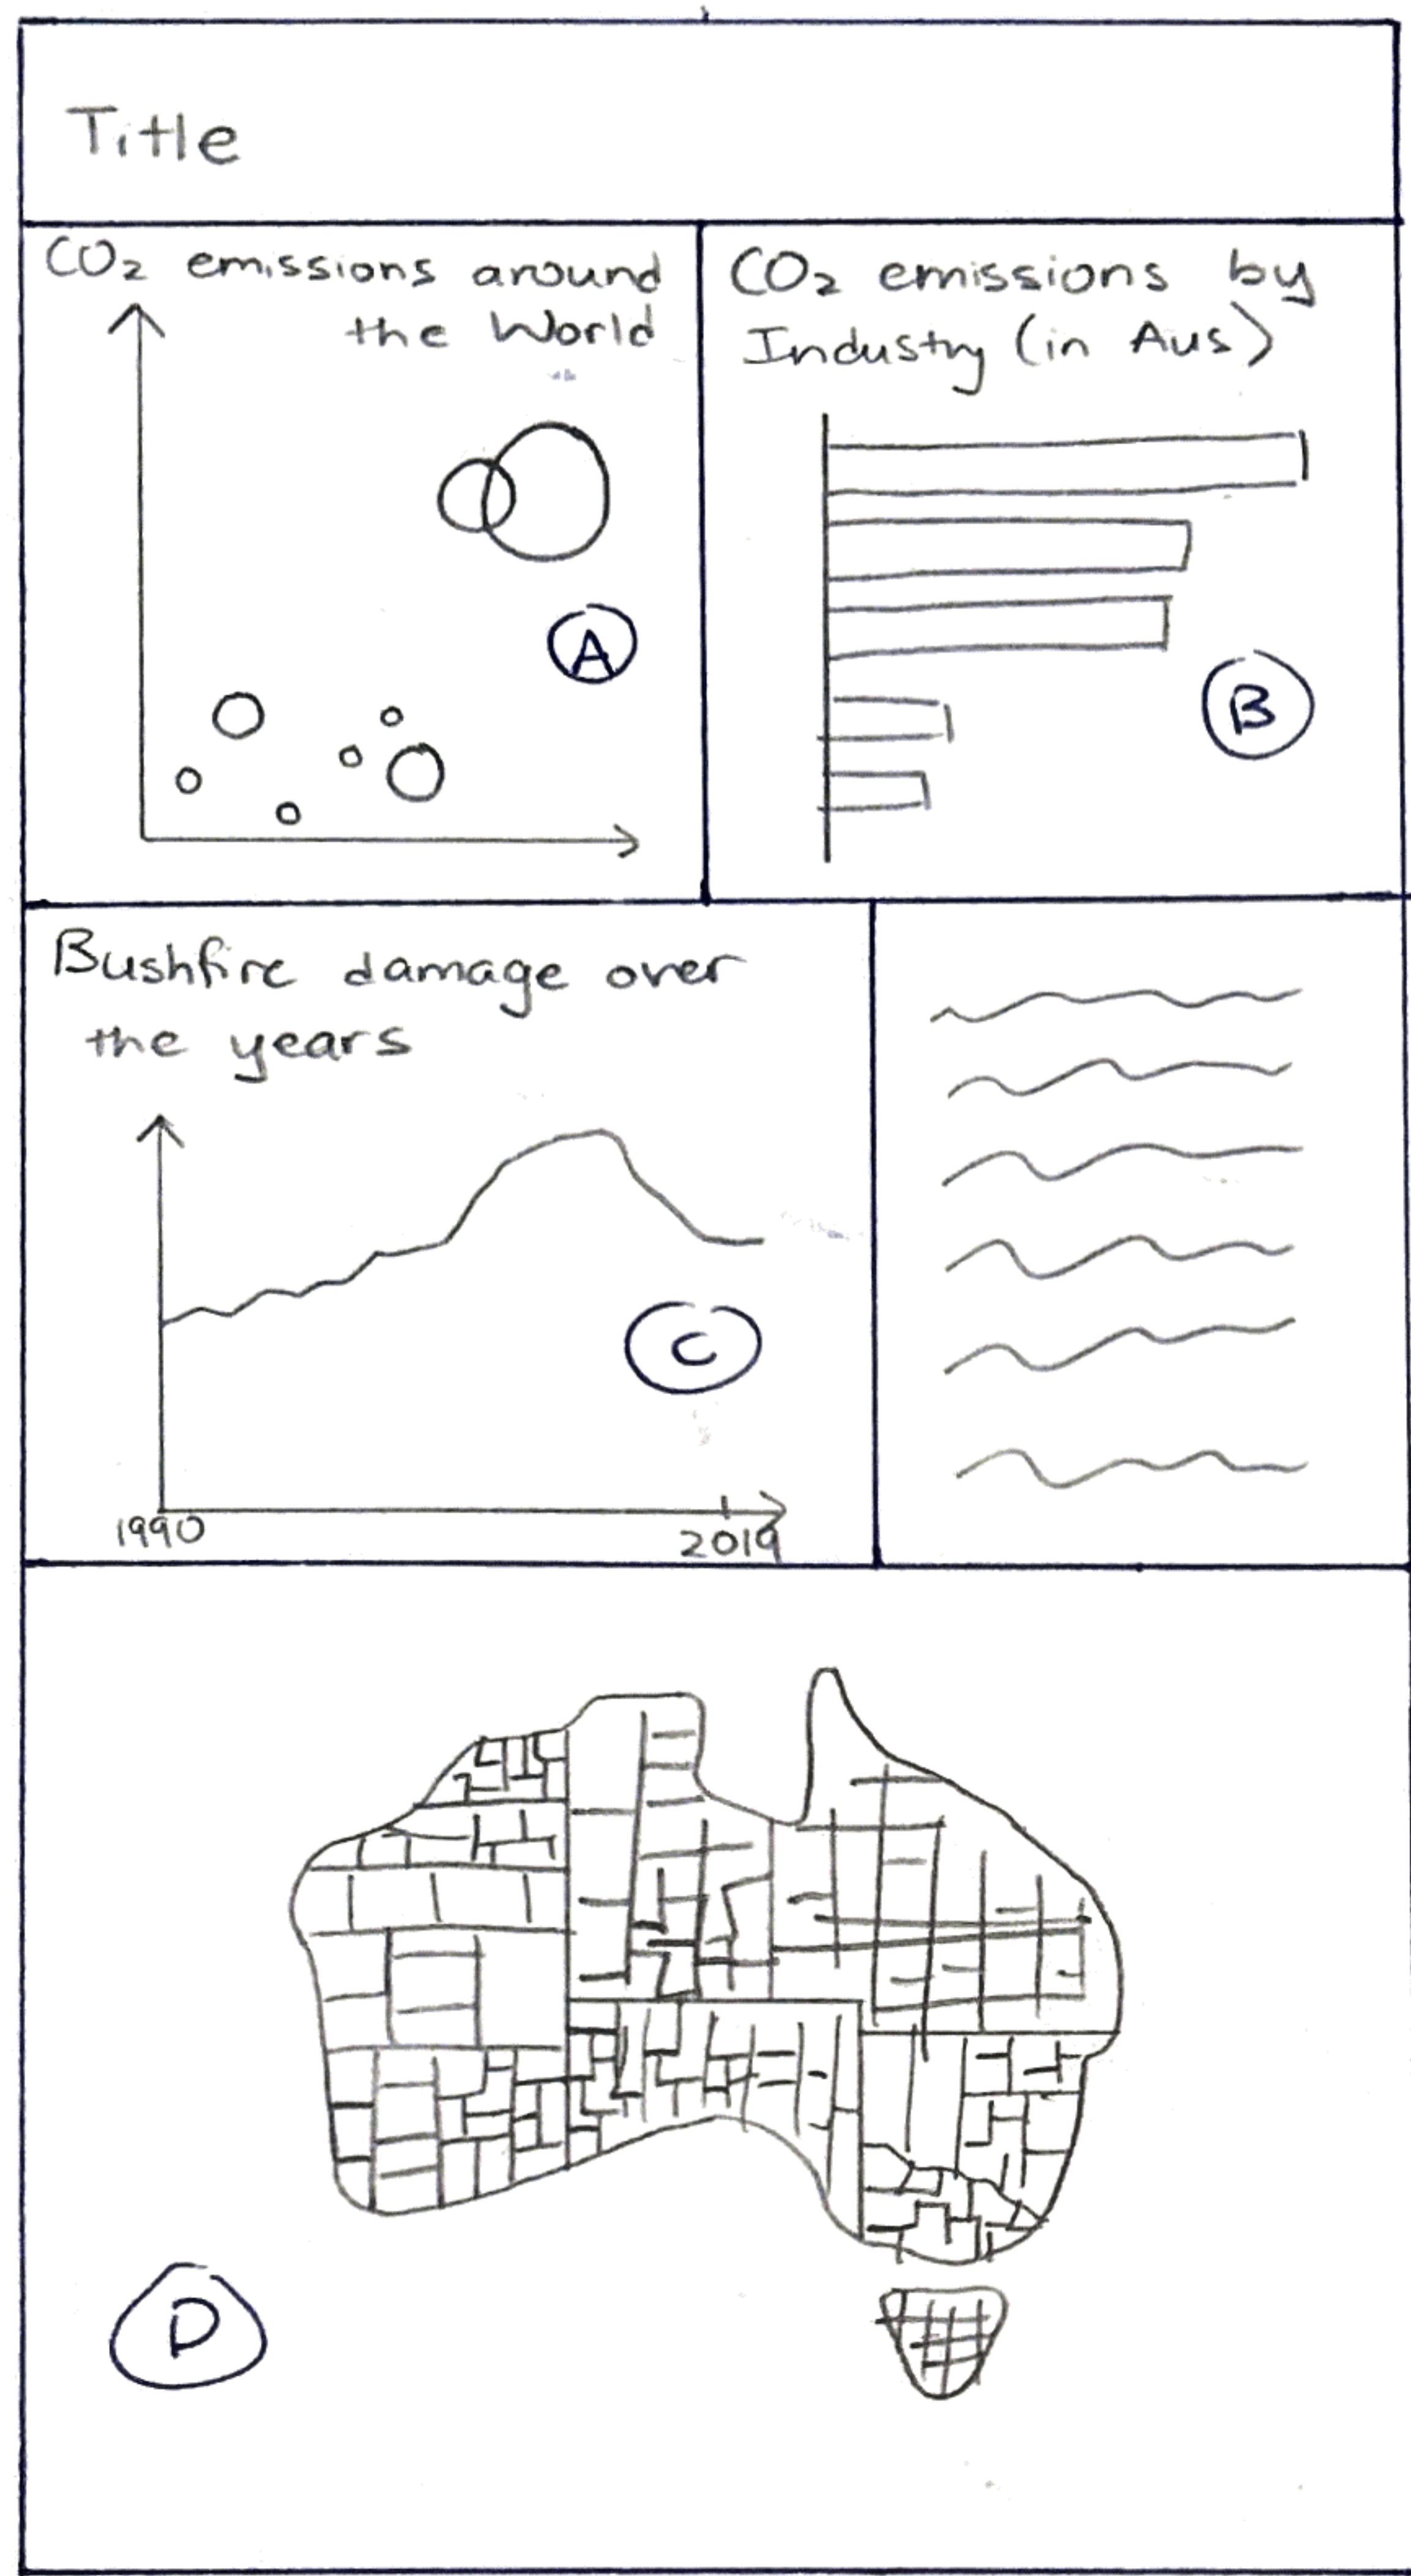

WA

Discussion

- Would like more graphs to blend the entire story together better.
- Happy with interactive operations however, am unsure on implementing them using Vega-Lite.

Layout

Title : Viz with story

Author : KAI WILLIAMS

Date : 22/09/2025

Sheet:3

Operation

- Add a legend for countries in chart A.

This helps ensure that small circles can also be observed rather than ignored because of smaller numbers.

- Slider for chart C.

- Add in significant climate change policies as annotations

Discussion

- Slightly better than sheet 1 ~~idea~~. in my ~~po~~ opinion. Story is more concrete and links with one another better.
- Taking a quick look at the data and what chart C will actually look like does not really fit with the story. But perhaps helps to build a point that damages to our environment will only be observed many years after.
- Still questioning whether to include the chart A. I like the outside in approach but am still undecided.

Focus

- Main focus is the charts C and D being bigger because the charts before that lead up to the conclusion made in C and D.
- Choropleth map will have a colour luminance, making areas with high areas burned size brighter and stand out.

Layout

Title: High Contrast Viz

Author: KAI WILLIAMS

Date: 23/09/2025

Sheet: 4

Operation

Town/City:
Area Burned:
Brightness index:
Date:

Add % increase/decrease from previous year and add colour hue (green/red) to indicate an increase/decrease.

Discussion

- I like placing the proportional symbol map being at the bottom with it also being the largest.
- Requires filler charts to be more descriptive and contain more valuable data.
- Need to decide what charts to use in the middle section of the data viz.

Focus

- There are two charts that are significantly larger than others, A and D.
- To make chart D stand out even more, make the background of the data viz dark and the red circles signifying the area burned a bright luminescent red. Along with the colour choices in other charts.

Layout

Title: Australia's Changing Climate

Author: KAI WILLIAMS

Date: 23/09/2025

Sheet: 5

Operation

- Allow filtering for all graphs so that we can compare all 3 graphs across the same time period.

Chart E

- Ensure tooltip is sufficiently descriptive.
- Ensure a table/filter so that smaller data points can be selected.

Details

- Need to familiarise and evaluate whether these graphs and filtering options are doable (by my standards) (and skillset) using VegaLite.
- Am unsure whether the data actually fits the narrative I am trying to point and do not want to lie with any data viz. May require my last text cell to be an explanation rather than trying to explain links.

Focus

- Charts A, B, C help build context while chart D is the largest. Chart D is the most eye-catching hoping to instill how serious the problem is.
- Charts E and F help round off the entire data viz and how we should move forward to ensure change.
